SUPPORT BOLSTERS

# Support Bolsters

STRONG, LIGHTWEIGHT SUPPORT BOLSTERS THAT PROTECT AND INCREASE EFFICIENCY

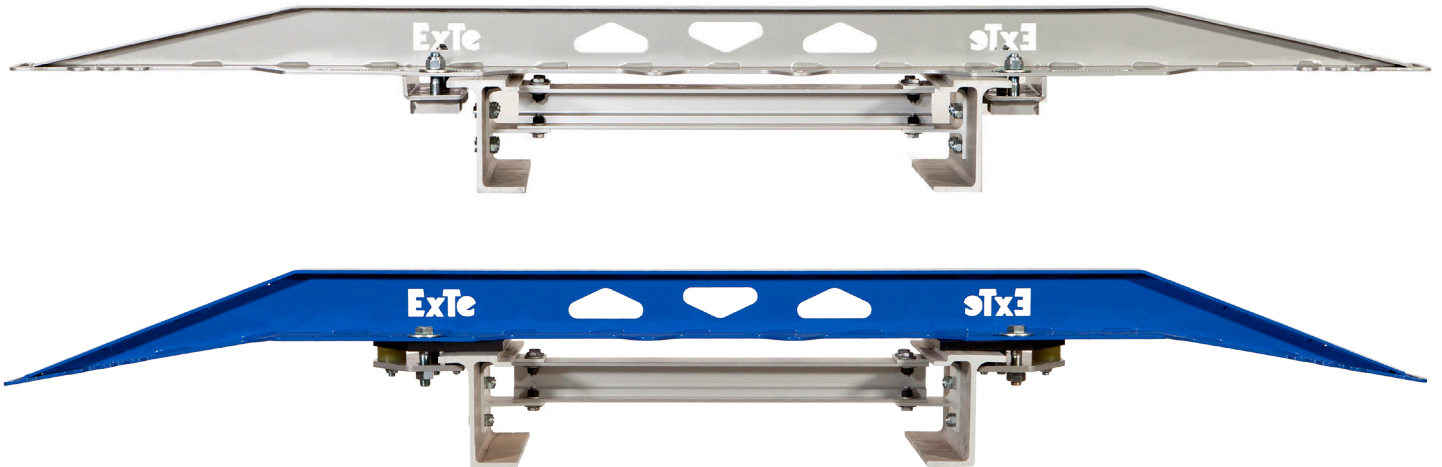

**ExTe**

Securing Cargo. We invented the Concept.

# A NEW SMART SUPPORT BOLSTER IN TWO VERSIONS

- Support bolsters protect the truck's frame when logs are unloaded, and they are now even faster and easier to install, using clamps or friction fittings.
- Grooves and indentations make it easy to adjust to different frame widths.
- No welding or drilling is required.
- Many pre-drilled holes and mounting points have been provided for fitting such accessories as hooks or straps.
- The straight support bolster is primarily fitted to trucks when tanks, mudguards, etc. restrict the available space.
- The support bolster with the angled ends is fitted where there is more space. The advantage is that the truck's grip claw is given more space during unloading.
- The bolster is designed for use with sliding cylinder attachment.
- The bolster only weighs 35 kg, its top is fitted with wear plates, and it can be delivered ready-painted and ready for fitting.

## EFFICIENT FITTING

The support bolsters are designed for quick and easy fitting. That saves time and reduces costs. The ExTe toothed fixing is patented. No welding or drilling is required.

## READY FOR ACCESSORIES

The support bolsters are fitted with attachment points for fitting a range of accessories.
